FOLDING COLLAPSIBLE WIRELESS TRANSMITTER-RECEIVER EARPHONE

BACKGROUND OF THE INVENTION

1. Field of the Invention

The present invention relates to a wireless transmitter-receiver earphone and, more particularly to a folding collapsible wireless transmitter-receiver earphone.

2. Description of the Related Art

FIG. 1 illustrates a wireless transmitter-receiver earphone constructed according to the prior art. This structure of wireless transmitter-receiver earphone **7** comprises a base **71**, a front extension **72** formed integral with and forwardly extended from one end of the base **71**, and a clip **73** provided at the back side of the base **71** and adapted for securing the wireless transmitter-receiver earphone **7** to the ear. The base **71** has a jack **74** adapted for receiving a battery charger. Because the front extension **72** is adapted to hold the microphone (not shown) close to the user's mouth, it has a certain length. Because the front extension **72** is not folding collapsible and has a certain length, it tends to be broken after removal from the user's ear, and the wireless transmitter-receiver earphone needs much longitudinal storage space when not in use. In order to eliminate this problem, the front extension may be made pivoted to the base. However, the

design of the folding structure must consider the possibility of damage to the signal line connected between the circuit board in the base and the microphone in the front extension during folding.

SUMMARY OF THE INVENTION

The present invention has been accomplished to provide a wireless transmitter-receiver earphone, which eliminates the aforesaid drawbacks. It is therefore the main object of the present invention to provide a wireless transmitter-receiver earphone, which is folding collapsible. According to the present invention, the folding collapsible wireless transmitter-receiver earphone comprises a base unit, an extension unit extended from one end of the base unit, a circuit board mounted inside the base unit, a speaker mounted in the base unit and electrically connected to the circuit board, a microphone mounted in the extension unit, and a signal line connected between the circuit board and the microphone. The base unit comprises an axle holder disposed at one end thereof, the axle holder comprising a chamber disposed in communication with the inside space of the base unit and an opening in a bottom side of the chamber. The extension unit comprises a hollow pivot shaft transversely disposed at one end thereof and pivoted to the chamber of the base unit. The hollow pivot shaft has a side opening disposed in communication with the bottom opening of the axle holder for the passing of the signal line from the circuit board in

the base unit to the microphone in the extension unit.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is an elevational view of a wireless transmitter-receiver earphone constructed according to the prior art.

FIG. 2 is an exploded view of a folding collapsible wireless transmitter-receiver earphone according to the present invention.

FIG. 3 is an elevational view of the folding collapsible wireless transmitter-receiver earphone according to the present invention.

FIG. 4 is a sectional view of the folding collapsible wireless transmitter-receiver earphone according to the present invention.

FIG. 5 illustrates the folding collapsible wireless transmitter-receiver earphone folded up.

FIG. 6 illustrates an application example of the present invention.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

Referring to FIGS. 2 and 3, a folding collapsible wireless transmitter-receiver earphone in accordance with the present invention is shown comprised of a base unit **1**, an extension unit **3**. The base unit **1** and the extension unit **3** are respectively formed of front and back shells **11, 12; 31, 32**. The base unit **1** holds a circuit

board on the inside, which comprises a speaker **13** and a microphone **15**. The microphone **15** is connected to the circuit board by a signal line **14**. The base unit **1** comprises a jack **16** disposed at one end and adapted for receiving a battery charger, and an axle holder **2** disposed at the other end. The axle holder **2** comprises a chamber **21** disposed in communication with the inside space of the base unit **1**, a coupling portion **22** at one lateral side of the chamber **21**, and an opening **23** in the bottom side of the chamber **21**. The extension unit **3** comprises a short hollow pivot shaft 4 transversely disposed at one end and pivotally coupled to the chamber **21** of the axle holder **2**. The hollow pivot shaft 4 comprises a hollow shaft body **41**. The hollow shaft body **41** has a coupling portion **42** pivotally coupled to the coupling portion **22** of the axle holder **2**, a side opening **43** disposed in communication with the chamber **21**, and a back wire passage hole **44** disposed in communication with the inside space of the extension unit **3**.

Referring to FIG. 4, the signal line **14** is inserted through the chamber **21** of the axle holder **2** and the side opening **43** and back wire passage hole **44** of the hollow shaft body **41** of the hollow pivot shaft 4 and extended to the inside of the extension unit **3**, keeping the microphone **15** fixedly positioned in one end of the extension unit **3** remote from the hollow pivot shaft 4.

Referring to FIG. 5 and FIG. 4 again, when not in use, the

extension unit **3** and the base unit **1** are folded up, preventing damage to the extension unit **3**. Because the signal line **14** extends through the chamber **21** of the axle holder **2** and the side opening **43** and back wire passage hole **44** of the hollow shaft body **41** of the hollow pivot shaft 4 to the inside of the extension unit **3**, folding up the folding collapsible wireless transmitter-receiver earphone does not twist or break the signal line **14**.

Referring to FIG. 6, the folding collapsible wireless transmitter-receiver earphone **6** can be used with a radio transceiver **51** to receive voice signal from a cellular telephone **5**, or to transmit voice signal to a remote side through the cellular telephone **5**. The radio transceiver **51** has a signal input/output line **52** connected to the earphone jack of the cellular telephone **5**. The folding collapsible wireless transmitter-receiver earphone **6** can be constructed subject to use bluetooth technology to the radio transceiver 51 for use with the cellular telephone **5**.

A protocol of folding collapsible wireless transmitter-receiver earphone has been constructed with the features of the annexed drawings of FIGS. 2~6. The folding collapsible wireless transmitter-receiver earphone functions smoothly to provide all of the features discussed earlier.

Although particular embodiments of the invention have been described in detail for purposes of illustration, various

modifications and enhancements may be made without departing from the spirit and scope of the invention. Accordingly, the invention is not to be limited except as by the appended claims.
